

SOCIAL SCIENCE WEEK - CLASS V (11.08.2017)

Climate change is a global problem. The planet is warming because of the growing level of greenhouse gases emissions from human activities. If this trend continues, truly catastrophic consequences are likely to ensue from rising sea levels, to reduced water availability, to more heat waves and fires.

Climate change is destroying our path to sustainability. Ours is the world of looming challenges and increasingly limited resources.

Keeping in mind, reusing the precious metals and plastics in an old electronic items alone instead of making or mining more of them would save as much energy as flipping off the power

Students were shown videos to get aware of this challenge. They studied the climate pattern of the last decade. They discussed the reasons and the solutions for the same. The students create innovative things out of e-waste.
